This survey of 1,500+ executives found that fundamental problems arise between the steps organizations take as they move from identifying new opportunities, acting on insights, and measuring the outcomes of their data-driven strategies.

The EY–Forbes Insights research shows that the way enterprises handle these junctures translates into business success and leads to clear stratifications in analytics maturity.

For example, top performers with advanced analytics strategies—among other maturity differentiators—are considerably more likely to enjoy growth in revenues and operating margins of 15% or more, along with significant improvement in their risk profile.

In an era of widespread business disruption, leaders aren't just using advanced analytics to improve existing activities—the strategic use of data is transforming traditional process driven organizations to help them become more competitive, increase revenues and profits, reduce risk, and guide them to new initiatives.

#### **Transforming cities and infrastructure for a sustainable future**

Read this whitepaper to learn how the right combination of digital tools is helping cities move from a reactive response to delivering a more sustainable future while saving costs and connecting the workforce to trusted data. These tools enable them to achieve operational agility, resiliency, and efficiency, while also delivering asset reliability, safety, and sustainability commitments.

#### **Using 21st century technology to protect smart buildings**

Facilities contain thousands of objects that make them function – dampers, motors, valves, fans and the ilk. When just one of these things fails, the rest of a building's ecosystem needs to make adjustments to compensate for its loss. Often undetected, such malfunctions and corrections increase operational costs and either put a strain on building systems or lead to their complete failure.

#### **Why next-generation reporting is critical for the water industry**

Although various water utilities systems are gathering more data than ever, many of them don't allow or enable decision-makers full use of that data to drive actionable insights, increase operational efficiencies, and automate the often-laborious process of generating reports. To harness data to its full capacity, it is critical to upgrade the way water utilities report by focusing on improved dashboards showing all parts of water systems in real time.

## Did You Know...

In [this survey](#) of more than 1,500 global executives....

- 70% of top performers have used advanced analytics to overhaul business strategies and update how they compete in their respective markets.
- 75% operate a full range of enterprise, departmental, and line-of-business analytics groups that operate within a well-aligned framework.
- Over the next two years, more than half of respondents plan to invest at least \$10 million in data and analytics resources. The Leaders will doubledown in this area, with 85% expecting to open their checkbooks to this degree.

## Tech Notes

### Adding Auto Reconnect Functionality to Device Integration Objects

When a Device Integration object gets disconnected from its data source (e.g. an AVEVA OI Server), it must be manually triggered to reconnect when the source becomes available again. By using some basic scripting, you can configure the DI Object to automatically reconnect to the data source when the connection is lost.

This tech note will instruct you on how to set up an auto reconnect feature and add additional diagnostic information that will indicate the number of disconnects the object has experienced since it last went on scan.

WHITEPAPER

## The four pillars of a trusted industrial information infrastructure

In today's data-centric landscape, organizations are under increasing pressure to find the right technology to support data requirements across their businesses.

Organizations must ensure they have a robust, yet agile, data-driven culture and framework from which to drive their digital journey.

This white paper explores the four pillars of a trusted information infrastructure. It will discuss why every successful industrial information infrastructure builds on **governance, trust, management, and a hybrid industrial architecture**.
